Part A: Peer Code Audit Checklist (LegacyLinearSubsystem.cpp)

Issue	Line number	Severity	Why it's a problem
printAll() loop uses <=	56	High	Reads one slot past the data, prints garbage
remove_item_at() has no upper bound check	29	Critical	Bad index 99 still lowers the count
Unused variables r and c	63	Low	Wasted code, compiler warning
Memory leak on resize: old array never delete[]'d before dataArray = temp	15-20	Critical	Heap memory leaks every time capacity doubles; can exhaust RAM
Memory leak on exit: no delete[] dataArray before return 0	96-97	High	Heap memory is never released when the program ends
Global variables (dataArray, currentCount, maxCapacity)	6-8	High	Any code can change them; only one array possible; hurts modularity
Redundant nested loop in remove_item_at() shifting	34-39	Medium	Inner loop runs once then breaks; confusing, wasteful code
Pointless dummy loop (k < 1) in findItem()	46	Low	Loop runs exactly once; adds clutter with no purpose
