---

1. IDENTIFIED STRENGTHS (At least 3 positive engineering practices observed)

---

[1] Enforced RAII by placing delete[] inside the class destructor.
[2] Used exception handling / bool error returns for out-of-bound access.
[3] Replaced raw magic numbers with const variables and clear template types.

---

2. IDENTIFIED WEAKNESSES / DEFECTS (At least 3 structural or style issues)

---

[1] The processMatrix() function still uses static parameter sizing.
[2] Lacks a copy constructor and copy assignment operator (Rule of Three violation).
[3] Missing explicit inline comments explaining the matrix transposition loop.

---

3. RECOMMENDED ACTIONABLE IMPROVEMENTS (At least 3 recommendations)

---

[1] Implement dynamic template support <typename T> for generic data types.
[2] Add an explicit shrink_to_fit() method to optimize unused allocated memory.
[3] Mark getter functions (e.g., getSize(), Search()) with the `const` modifier.

==========

DEVELOPER ACTION & REJECTION JUSTIFICATION (To be filled by Author)

==========

Recommendation [1]: [ACCEPTED] - Will refactor dynamic array to use template classes.
Recommendation [2]: [PARTIALLY ACCEPTED] - Kept manual capacity controls for Milestone 1 scope.
Recommendation [3]: [ACCEPTED] - Added `const` specifiers to all accessor methods.
